

No, everything does not have to be Markdown.

The instructions inside your **SKILL.md** file **must be Markdown**, but the wiki and reference documents inside your folders can be almost any text format you want. [1]

Claude has file-reading tools that can natively scan .md, .txt, .csv, .json, .yaml, and even code files. [1]

How to Structure Your Wiki Folders

You can drop your exact raw wiki files into a references/ folder without changing a single line of text. [2]

Here is how you structure your four master wiki skills:

```
termux-builder/
├── SKILL.md          <-- (Markdown format)
└── references/
    └── termux_wiki.txt  <-- (Any text or raw format)

aesop-protocols/
├── SKILL.md          <-- (Markdown format)
└── references/
    └── aesop_protocols.md  <-- (Can be markdown or raw text)

horizons-ui/
├── SKILL.md          <-- (Markdown format)
└── references/
    └── horizons_frontend.json <-- (Can be JSON, Markdown, etc.)

qairt-backend/
├── SKILL.md          <-- (Markdown format)
└── references/
    └── qairt_runtime.txt  <-- (Any text or raw format)
```

How the SKILL.md File Points to Your Wiki

Inside the SKILL.md file, you write standard Markdown instructions telling Claude exactly which file path to read: [3]

name: aesop-protocols

description: Use when the user asks about the AESOP memory layer or protocols.

AESOP Protocols Skill

1. Look inside the `references/aesop\_protocols.md` wiki file.
2. Read the protocols and answer the user's question exactly as specified in that file.

Claude will find the SKILL.md first, see your instruction, and then use its built-in tools to read whatever wiki file you pointed it to. [4]

Are your wiki files currently formatted as **individual .md files**, or are they all combined into **one massive document**?
