

Termux Survival Guide: For When You Forget Everything

Termux Survival Guide: For When You Forget Everything

1. What is "Base Camp" and where am I?

- When you open Termux, you see `~ \$`.
- The `~` is your "Home" base.
- If you ever feel lost or get "file not found" errors, just type: `cd ~` (This teleports you back to the start).

2. How to talk to your files (Storage)

Termux starts in a locked box. To see your actual Android files (Downloads, Photos), you must unlock it once:

1. Type: `termux-setup-storage`

2. Press Enter.

3. A popup will ask for permission—**tap Allow**.

4. Now you can get to your downloads by typing: `cd ~/storage/downloads`

3. The "Copy & Paste" Safety Drill

1. **Highlight & Copy** any code from your Keep notes.
2. Go to Termux and **long-press** on the black screen.
3. Tap **Paste**.
4. **Important:** Press the **Enter** key on your keyboard to actually run the command.

4. What if "Nothing Happens"?

If you paste a command, hit Enter, and the terminal just shows a new blank line with a `\$`—**it worked!**

- In terminal-speak, "no news is good news." The computer did exactly what you asked without complaining.

5. Essential Commands to Remember

- `ls` : Lists the files in your current folder (like "Show me what's in here").
- `pwd` : Tells you exactly where you are standing (the full file path).
- `source ~/.bashrc` : The "Refresh" button. If you ever paste keys or settings and they don't seem to work, run this to force the computer to "wake up" and use the new settings.

6. Where to find your keys & setup

Always check your other Keep notes:

- **"Termux Master Launcher & Setup Prompter"** (for the heavy lifting).
- **"Adding API Keys to Termux Environment"** (for connecting to Google).

Termux Master Launcher & Setup Prompter

Termux Master Launcher & Setup Prompter

1. Safe Initialization (Run First When Lost)

If commands are failing or files aren't found, copy-paste this line to reset back to base camp, verify your path, and see your files:

...

```
cd ~ && pwd && ls
```

...

Expected safe output: `/data/data/com.termux/files/home`

2. Environment Refresh & Activation

After pasting any keys or hooks into your profile, run this to force Termux to lock them in immediately without restarting the app:

...

```
source ~/.bashrc
```

...

3. Core Setup Verification Checks

Run these commands to verify that your master keys and agents are properly attached to the background environment:

- Check Google Cloud Project ID:

...

```
echo $GOOGLE_CLOUD_PROJECT
```

...

Expected: `main-catwalk-492516`

- Check Passkey JSON Path:

...

```
echo $GOOGLE_APPLICATION_CREDENTIALS
```

...

Expected: `/data/data/com.termux/files/home/vertex-key.json`

4. Copy / Paste Safety Drill

1. **Highlight & Copy** the text block from Google Keep.
2. Go to Termux, **long-press** anywhere on the black terminal screen.
3. Select **Paste** from the popup menu.
4. If a command runs silently and shows a new blank line with a `\$`, it **succeeded**. Do not expect a confirmation message.

Recommended Termux AI Agents and CLIs

Recommended Termux AI Agents and CLIs

1. Open Interpreter

Translates plain English instructions into actual terminal commands executed locally on your system. Ideal for file system management and automation. Installation Command: `pip install open-interpreter` Usage: Type **interpreter** to launch the environment.

2. Aider

An autonomous terminal-based pair programmer that directly edits local code files and automatically handles git commits. Installation Command: `pip install aider-chat` Usage: Run **aider** inside any coding project folder to begin co-authoring scripts.

3. Fabric

A command-line prompting platform optimized for advanced text extraction, video summarizing, and heavy structural text formatting. Installation: Follow the official setup guide via pip or go. Usage Example: `cat article.txt | fabric --pattern extract_wisdom`

Termux Web Scraping and Markdown Merging

Termux Web Scraping and Markdown Merging

1. Core Jina Scraping Command

To pull any web article into Termux as clean text without website layout junk: `curl [suspicious link removed] > article.md`

2. Merging Multiple Markdown Files

To combine an entire folder of individual articles or notes into a single mega-document for NotebookLM source limits: `cat *.md > Project_Master.md`

3. Automated Web Reader Hook (`vagent_read`)

Add this to your environment to pass a URL straight to your AI voice agent: `echo 'vagent_read() { URL=$1 echo "Reading article..." CONTENT=$(curl -s "[suspicious link removed]") echo "$CONTENT" | claude -p "Analyze this article content and give me the best outside-the-box engineering ideas" | tee /dev/tty | termux-tts-speak }' >> ~/.bashrc source ~/.bashrc`

How to Use the Automated Script

Just trigger your keyboard microphone and say: `vagent_read [suspicious link removed]`

Android Native Voice Agent Stack

Android Native Voice Agent Stack

1. The Core Environment Exports

Run these commands to permanently inject your Vertex JSON key and Google Cloud settings into the background of Termux:

...

```
echo 'export GOOGLE_CLOUD_PROJECT="main-catwalk-492516"' >> ~/.bashrc
```

```
echo 'export GOOGLE_APPLICATION_CREDENTIALS="/data/data/com.termux/files/home/vertex-key.json"' >> ~/.bashrc
```

```
source ~/.bashrc
```

...

2. High-Quality, Lowest-Latency TTS Setup

Instead of cloud APIs, turn Sherpa-ONNX into your system-wide voice engine:

- Install the pre-compiled **Sherpa-ONNX Android APK** (which includes optimized offline VITS/Piper neural models).
- Open your tablet's global settings: **Settings > Accessibility > Text-to-Speech**.
- Change the **Preferred Engine** from Google to **Sherpa-ONNX**.
- Open Termux and install the Termux API toolset to bridge the audio:

...

```
pkg install termux-api -y
```

...

3. Creating the Voice Agent (`vagent``) Terminal Hook

Run this block to create a permanent command that runs your AI, displays the text, and instantly speaks it out loud using your hardware's offline speech engine:

...

```
echo `vagent()` {  
  
    claude "$@" | tee /dev/tty | termux-tts-speak  
  
}` >> ~/.bashrc  
  
source ~/.bashrc  
  
...
```

4. Direct Voice Input Configuration

- Set **FUTO Voice Input** as your active system keyboard.
- Open Termux, type `vagent`, tap the microphone icon on the FUTO keyboard, and speak your command natively without any background recording scripts.
