README

AESOP — Agentic Executions Split Operations Protocol

A device-agnostic protocol for running a **split** agent stack across the machines you already own — mobile, workstation, home node, and cloud — behind **one shared, auditable memory**.

Aesop distilled a moral from every fable. **AESOP** distills a **strategy from every trajectory**.

What it is

AESOP defines a small set of **agent roles**, three **memory types**, and a set of capability **tiers** that any hardware maps onto. Roles bind to tiers with graceful fallback, so the same stack runs whether you have a phone + laptop + cloud, or a full home-node rig. The specific hardware layout is a **profile**; the protocol itself is device-agnostic.

Agent roles

Role	Job	Default tier
Query / tool-exec	intake, meta-prompting, tool calls, reads memory	Edge (mobile)
Executive	heavy reasoning, direct file/memory access	Home node → Cloud
Librarian / switchboard	intercept prompts+outputs, select memory, log, commit learnings back (the flywheel)	Home node
Auditor (red)	independent gate on side-effecting actions; judges trajectories	Cloud (out-of-band)

Memory — three types, markdown as interchange

Memory	Holds	Backed by
Declarative	facts, "what things are" (source of truth)	wiki markdown — OpenWiki / Obsidian

Memory	Holds	Backed by
Recall	semantic search across everything	OB1 / Open Brain (vector)
Strategic	distilled reasoning from successes and failures	ReasoningBank (fed by the auditor)

Markdown is canonical and human-auditable; the vector indexes are **derived and rebuildable** from it.

 Repo layout

```
aesop/
  ARCHITECTURE.md      # the full spec
  protocol/            # tier definitions + role→tier bindings + fallback ← device-agnostic, public
  profiles/            # hardware→tier mappings ← personal
    _example.yaml      # the common case: phone + laptop + cloud
    nav.yaml           # a full 4-tier reference rig
  clients/omni-claw/   # on-device UI / client layer
  agents/              # query · executive · librarian · auditor contracts
  memory/              # wiki + OB1 + reasoning-bank adapters
  deploy/              # per-tier bootstrap
```

 Status

Private draft. `protocol/` is device-agnostic and intended for public release; `profiles/` holds personal hardware mappings and stays
