

AI_STUDIO_APP_BUILDER

When you enter Google AI Studio's **Build** tab to create an app from the side panel, you should use **natural language mixed with UI specifications**. Since AI Studio handles the code generation (defaulting to React for web or Kotlin for Android apps), your description needs to act as a clear blueprint. [1, 2, 3, 4, 5]

1. Define the Core Framework

Before typing your description, look at the **Platform Picker** in the configuration panel. Select your target environment: [1]

-
- **Web App**: Choose this to generate a full-stack React/Vite frontend and a Node.js backend.
- **Android App**: Choose this to generate a Kotlin and Jetpack Compose project. [1, 6]
-

2. Structure Your Description Prompt

Do not just say "make a fitness app." The side panel needs structural clarity. Break your prompt down into three segments:

-
- **The Goal (MVP)**: State exactly what the app does in one sentence (e.g., *"An idea inbox app that saves notes locally and formats them for Obsidian."*). [7, 8]
- **The Layout Structure**: Define the screen views (e.g., *"Create a mobile-friendly view with a top navigation bar containing three tabs: Dashboard, History, and Settings."*). [9]
- **Component Details**: Specify exact fields, buttons, and datatypes (e.g., *"The entry form needs a text input for title, a text area for content, a dropdown for priority, and a submit button."*). [10, 11, 12]
-

3. Use Multi-Modal Inputs (The Secret Weapon)

Stop relying entirely on text. If you have a visual concept, leverage these side-panel tools:

-
- **The Annotate App Tool**: Take a screenshot of the app Gemini drafts, draw directly on it (like circling an area and writing *"Move this button here"*), and hit send. [13]
- **Image/Folder Dragging**: If your app processes specific data (like a clothing catalog or real estate listings), drag a folder of sample images directly into the sidebar. The model will automatically analyze them, generate metadata, and map them straight into your live frontend mockup. [14]
- **AI Chips**: Click the AI Chips feature in the panel to instantly inject native integrations like **Google Maps data** or **Image Generation** without writing complex code. [15]
-

If you want to map out your app right now, tell me:

-
- What **type of app** are you building?
- What **features or screens** do you want?
-

I can write out a perfectly structured prompt for you to copy and paste directly into the AI Studio side panel.
