

Since this is being designed as a universal memory layer this will all sit under one giant umbrella which is the Modul4r_corpus.

Under that main folder will try to keep everything as flat as possible the first one is going to be only a couple layers deep the main folder would be

Mo()u14R_Inc.

Grand Repository=

Everything that we build design and format, is aimed at problem-solution based ethics.
'When you're a Hammer- Everything is a Nail'.

- Right to own your own hardware
- Planned obsolescence.
- Industry organized, monopoly led price gouging over memory layers.
- Proprietary air gaps.
- Network silos
- Holes in workflow.
- Unnecessary steps towards outdated endpoints.
- Model dependency.
- Leashed ecosystems.
- Sandboxed applications....

(AND THE PART NOBODY WANTS TO TALK ABOUT)

Profit margin subsidies, and a potential market wide bubble-burst, the likes of which we haven't seen in generations.

We're here to bridge the gap between your average. non-professional, semi-tech literate consumer and your Enterprise grade power users. Giving everyone the same tricks, tool boxes, skill sets and user capabilities..

"An even playing field~In ever~ evolving **Horizons** "

™

Welcome to our new- Always user owned, Always affordable and always **Modul4r®** ecosystem.

Instead of a bloated/underachieving redundant [human in the loop] system. And ball-and-chain proprietary infrastructures-

All of our projects strive to be their autonomous, hyper-efficient, easy to use- **Human Builds The Loop-** counterparts....

And our focus is: **[Augmentation, not Automation]**

Instead of the tools being the master of their domains **YOU** become the master of your tools. In **Every** domain.

The first subfolder in the header dock=

Read me.

What it is it can lay out the framework quick how to obviously follow the who what when where why how

And that being said even laying out the architecture of the folder file itself the folders will be formatted in that kind of order as well.

Small glossary perhaps eventually a URL library

Claude MD whistle showcase upcoming projects or point at current sotu across the domain

And then the last file could be whatever that markdown version of math the AI uses I can't remember what it's called it's almost it looks like low Rob and it's something different basically it like a chopped mark down that will house the glossary and the you know like the glossary in the URL file for the agents

Now stepping back out onto the same flat plane as the grand repository and we'll start **Aesop-XI-** ethical algorithm and protocol management across an agentic hybridized neuromesh [human builds the loop] environment with

I still haven't decided if this one is going to be its own repo or not I mean it's so expanding over so much so many different things it almost seems like it would be redundant because everything that it touches there's probably going to be several repos under this umbrella alone a

But then again maybe we could cram it all into one n

Anyway we'll start with the same w5h read me this one will be pretty dense I want you to review that page 9 through 109 and mimic those same style the master blueprints specs workflow diagram build maps etc and then this one will also have that 4 file structure

And then instead of getting balls deep and nesting will hop back out to the same flat plane and we'll start with the defining repos as far as protocols go and then we'll cover all of the memory tools that finish up that memory layer then we'll step into the memory what layer this one is going to be

OmniRoute

Same forur plus you are a URL linklink to the forked repo and the same with the rest=step back out into the same flat plane and then

OB1/ then it's docks inside

Mem0/

Reasoning bank/

Then under the individual me,mory tools id want the persistent universal memory layers

Llm-wiki

Obsidian -skills

Graphify

Notebook Impy

Claude video

and I'm going to throw more in this category but I'm not sure exactly which one if it's going to be the individual tools or the persistence layer which category would fall under

Nova code review graph

And there's also Pi Pi but I'm not sure if that goes in this category or just a regular agent tools category

I also have open ship and something called ECC and then of course the open Wiki but that's a tui that's more of agent tool I mean that's going to how I'm going to utilize the Llm wiki

And I know a lot of those already come with mCP servers already baked into them like Omni route and ECC and probably a couple other ones but if any of them don't hit the right spots then I might have to plug in some other ones or create my own as well

So then after that memory layer you know in that same folder you could and I guess those would be kind of a what and the where the hell would be all the invoking scripts that would come along with that and then here also something about this I don't know if you want to place this under the red agent but there could be a whole section on the recursive k a g the jsonl the storage pipeline how you know compressing the PDFs scripts for the red agent the script for the files management system the scripts for data storage or how to invoke data retrieval scripting for the npu management scripting for the inference between the pure servers and the home node the house cleaning and just like I'm going to have a tiny agent for instruction manuals and

Builder guides I don't think it would be too far fetched to create one for the memory layer and files management system because those basically tie in together hand to hand it would be nice to have a dedicated nanoagent for this

After the memory part I think we get into novus agenda / novaclaw

So you can start with a novus agenti in those documents the typical standard ones that it would be nested but then I think I would put everything else on the outside playing right the model waits we might want to break those up into proprietary or organizational I'm not sure or Enterprise I guess you would call it like all the Google ones in one all the llamas and one or the open router in one section clan in one section then all of your the agent and see allies that you mentioned plus I have a couple more stuff like you know I might want to try out crew AI or I definitely know I'm going to be using the ECC or eec and the pi agent so I don't know if those people in that category and I think Incorporated you know incorporated into these would be teamucks that could live in here as well as could the skills if that's a big giant section and being that it's kind of a flat folder plane it doesn't really matter just more for ease of my retrieval but I have a lot of well not all I have probably a handful of t-mucks repose as well as some scripts and stuff in the proprietary arenas we got all the qai RT qnn documentation I got a bunch of unslaughter will have GitHub and hugging face will have installed guides for pretty much fucking everything and we can get into mCP servers as well and then underneath that would be the physical device stacks in the claws you know The horizon's UI the other two nodes the tail scale all those permissions and sockets and scripts and everything that's going to have to go into that all the configurations that weren't already covered in the Aesop any ideas that we build or custom-mcps and I think either right above this or right below this we would have to do the red agent in the recursive KAG layer along with Moe moa configurations that we have for the home node and then you would have your corpora at least I get away with that one layer nested but sprawled out Canon corpus then would be pending corpora

Then I would want a folder set on proofs and reverse engineering documents after that would be like a research manifest and then an archives and actually before the corpora documents I would like my own special projects division as a matter of fact I should probably sit up top right after the read me and then before that I'll do my own personal Wiki/cloudmd it'll have the similar structure but also my to-do list and both of these main folders are going to have will put slugs for IP slugs basically for anything that I have in and sealed folders or secure folders more reference them with the slug and we'll also have a scripted path for any of the agents that I'm using that can upload to my business accounts gcp bucket I can for like access accessible storage for private llm config since that will be locked behind an Enterprise security walls and then let me know I'm about any corrections to the architecture that you think should happen or if any additional documents that I was missing but I kind of like that layout myself
