

AGENTS.md — novus-aesc Agent Operating Contracts & Boundary Invariants

Operational Scope

This document governs all automated agent behaviors, subagent executions, and tool interactions within the `novus-aesc` repository.

Non-Negotiable Hard Rules

1. **The First-Move Directive:**

- Always read `MAP.md` first to orient.
- Query `manifest.jsonl` to locate specific files; NEVER load the full manifest into context.
- Load only the specific targeted file paths required for the task.

2. **Non-1:1 Condensation Law:**

- Preserve 100% of technical rules, parameters, paths, and build context.
- Strip conversational fluff, boilerplate, and duplicate logs.

3. **Red Auditor Stealth Invariant:**

- The Red Auditor agent operates strictly in `~/.red/` and MUST NEVER appear in repository file trees, manifests, or public documentation.

4. **Shell Execution Safety (UID 2000):**

- Commands routed through `adb\_loopback` must validate arguments against shell injection.
- Never expose raw ADB root/shell control beyond local Unix domain sockets.

5. **Locality of Reference:**

- Procedural skills and executable tools developed for `novus-aesc` must reside in `skills/` and `tools/` respectively within this repository.
