

Project __NovÆxorpus(NÆX)

In my Google Drive you will find the two Master folders the first one is going to focus on the phase 1 through 4 and primarily utilize the master folder __NovÆxorpus(NÆX)

Phases 2 through 8 will involve the other Master folder __Lex-Novi-Æxentis-Copiæ you have full access to both. Make as many copies add as many variations as you want just leave all the originals intact.

First up phases 1 through 3=

- 140 files for review
- New structure proposals
- Curation implementation in migration final extraction before

phases 4 through 8

Grill with docs session. After that begins Final data implementation and classification of the official #= Database & Universal Memory Bank Across Split Services
After which we will do the final wiring in the creation implementation of the

Æsop-Xi ethical orchestration protocols

Enterprise wide distribution of the
#dumbass

Launch of the logic behind
NovusÆxenti

Final wiring of all tools associated with
NovÆxopia

Official launch of the NovÆxorpus along with the absorption of all remaining repositories

And the final build out and structuring of the new repositories for Horizons-Ui, ÆEsc, ÆEyre, and all Incorporated agents forms on device agents cloud instances GenAi projects and home workstation build-outs

Phase one- 140 file review.

Attention:

There is very little separation between the s tier folders and the a tier folders but everything is primarily numbered in order do not bounce around.

Treat every piece of data in here as an important piece of data.

The user definitions and the user prompts in many of these entries clearly define the target scope.

Ask questions to get the complete picture or if you have any uncertainties

This is many hours of research several hours of planning. Days and days of curation consolidation files aggregation fact-checking and exploratory research spanning several weeks and months.-

Days of curation in this presentation alone, on top of the months that are reflected in ___Lex-Novi-Æxentis-Copīæ

DO NOT JUST HAND WAVE ANY OF THESE DOCUMENTS, DISREGARD ANYTHING BASED ON SLIGHT INCONSISTENCIES OR DEVIATIONS. OR JUST SIMPLY SHIT OUT A RESULT. TAKE YOUR EFFING TIME!

AND READ EVERY SINGLE FILE

TREAT EVERY SINGLE FOLDER AS ITS OWN PROJECT.

Not every single document is perfect but there is a lot of good information throughout this entire stack

Find inconsistencies. find duplicates find instances where documents can be combined consolidated reformatted data can be shrunk down and curated etc

Some things that need further elaboration.

- The points that were brought up by the glm review
- Omni route is a memory extraction layer
- Sqlite, postgres, continual harness, in conjunction with the commonly mentioned tools for implementation of the dumbass
- Too much reference of the red agent as a generalized part of the whole schema when in fact this thing is supposed to be incognito and unknown to the entire rest of the Enterprise
- Node js, the ADB loopback the desktop project on device help desk and open Wiki build out utilizing the salvaged Horizons APK
- Utilizing the Enterprise data that we have for agent building
- More to be stated later....

These 140 documents will eventually be cross referenced against every single thing that I have in - ___Lex-Novi-Æxentis-Copīæ

Wherein another similar compilation and data extraction will take place

Expected results: correlation combination data extraction it needs to be made can be done so by making your own copy of the original or creating new content.

propose a completed file tree folder structure based on the data. Make a proposal for chopping the dead weight out of __NovÆxorpūs(NÆX) and __Lex-Novi-Æxentis-Copiæ based on your review of these 140 documents.

__Lex-Novi-Æxentis-Copiæ has a folder layout that I am going to keep for the remainder of the data compilation phase.

That being said use the data compiled from the 140 file review, cross analyze the findings from the 140 file review against the data that is held within __Lex-Novi-Æxentis-Copiæ

After all analysis I would like you to pitch a final occupation for the folder tree structure defined in the S tier folder as well as build out the folder structure for every single future repo and every folder that is inside of __Lex-Novi-Æxentis-Copiæ

Remember create a master copy of everything and make lists to give me I will do the removing and the deletion don't be afraid to combine documents that are not Enterprise reference documents or official research papers

Don't be afraid to trim a lot of fat off of many of these documents when you propose a final copy

Again read everything treat each folder as its own project do not shit out results faster you give me an answer the more skeptical I'm going to be of the quality.

Explain your logic behind your decisions explain alternative options and propose more than one finalized version.

Godspeed
