

Mixture-of-Agents (MoA) Consensus Audit Protocol

Mined from: `PLUGINS TOOLS AND MEMORY LAYER ARGUMENTS (Files 7, 11, and 'And I know I'm.txt')`

Core Principle: Scope to High-Stakes Promotions

A single auditor model cannot reliably catch its own blind spots. A Mixture-of-Agents (MoA) ensemble drawn from distinct model families catches architectural drift and hallucinated paths before code or specs enter production.

Operational Scope

To prevent runaway compute costs, MoA consensus is strictly scoped to **high-stakes transitions**:

1. Promoting a document from `Pending` → `Canon`.
2. Any modification touching frozen/immutable paths (`01_raw_sources/`).
3. Overriding or modifying core security policies in `aesop-xi/policies/`.

Routine daily traffic runs through a fast single-pass check (0.8B / 9B).

Disagreement & Fail-Closed Rule

If the ensemble models split their verdict (e.g. 1 PASS, 1 FAIL):

- **Automatic Fail-Closed:** The candidate batch is quarantined immediately into `.incognito_red_sandbox/quarantine_logs/`.
- **Human-in-the-Loop Escalation:** An alert is logged to `UNRESOLVED.md` for operator review. No candidate batch self-promotes on a split vote.
