
name: ecc-agent-harness description: Everything Claude Code (ECC) multi-agent harness protocol for managing instincts, memory access, and cross-CLI execution consistency.

Everything Claude Code (ECC) Agent Harness Protocol

Mined from: `PLUGINS TOOLS AND MEMORY LAYER ARGUMENTS (File 6)`

Purpose & Scope

The ECC Harness governs how Claude Code CLI, Codex, and local execution agents maintain shared operational memory, behavioral instincts, and security constraints.

Invariants & Rules

1. **Universal Memory Reach:** Agents executing through ECC must query the local `#d.u.m.b.a.s.s.` SQLite/OmniRoute interface before proposing file changes.
2. **Context Window Protection:** Never inject full source files if AST structural maps (e.g. via `graphify`) are available.
3. **Session Closure:** Every execution session must terminate with a clean state summary written to `RESUME.md` and an inventory update in `manifest.jsonl`.
