Five-Bucket Curation Triage Protocol

Mined from: [PLUGINS TOOLS AND MEMORY LAYER ARGUMENTS \(File 1\)](#)

Core Directive: Triage Before Topical Filing

You cannot place a document by subject until you know whether it is true. Documents entering the corpus must be categorized into one of five distinct disposition buckets:

Bucket	Purpose & Criteria	Action Taken
Canon	Settled, verified truth. Everything trickles down from this.	Move to repo root or canonical spec directories. Immutable law.
Pending Corpora	Experimental, unproven, or draft architectures requiring operator sign-off.	Move to staging / review holding queue.
Vault	Alternative build approaches, historical setups, or deep reference manuals.	Retained in cold storage (01_raw_sources/) for future study.
Reverse-Engineering	Decompiled assets, salvageable code, and failback mechanisms.	Staged in reverse_engineering/ for recovery.
Toss	Stale, redundant, or dead conversational noise.	Marked for operator deletion. Zero inclusion in manifests.

Workflow Rules

1. Never guess canon: If an architecture contradicts the operator's latest directive, flag as Pending.

2. Promotion rule: Promotion from Pending to Canon is an explicit event tracked in `RESUME.md`.
