
name: wiki-reference-router description: Use when an agent needs to retrieve factual knowledge, schemas, or protocols from local multi-format references without modifying raw files.

Wiki Reference Router Skill

Purpose & Scope

Governs how agents locate, parse, and cite multi-format documents housed inside `references/` directories across repositories. The instructions inside this skill remain pure Markdown, while referenced assets may include `.md`, `.txt`, `.csv`, `.json`, `.yaml`, or code files.

Operational Directives

- 1. Never Assume Monolithic Markdown:**
 - Raw references are preserved in their native format under `references/`. Do not expect all references to be converted to `.md`.
- 2. Deterministic Lookup Chain:**
 - Step 1: Read the local `MAP.md` to identify which reference folder holds the target domain.
 - Step 2: Open the specific target reference file (e.g., `references/aesop_protocols.md`, `references/termux_wiki.txt`, `references/horizons_frontend.json`).
 - Step 3: Extract only the requested facts, tables, or code signatures without dumping whole files into conversational memory.
- 3. Immutability Guarantee:**
 - References are read-only. Never write, update, or append notes directly to `references/` files. Any synthesized conclusions must be written to `02_wiki_md/` or episodic logs.
