

The other agent treated vendor data like an afterthought, whereas in reality, **Google**, **Qualcomm**, and **GitHub** each form massive, standalone technical architectures within the stack.

Based on the blueprint in

[PROPOSAL-V2-CORRECTED-WIKI-TERMINOLOGY-AND-ALTERNATIVE.md](#) and the raw assets in your corpus (Agent-Assets&Global-Documentation_Vault, Google_Build, and --•📱🔗_GITHUB_📁🖥️~), here is the dedicated vendor breakdown:

1. Google Ecosystem (vendors/google/)

- **platform/ (GCP & Agent Infrastructure)**: Vertex AI Agent Builder, Cloud Shell, Cloud Run container deployments, Antigravity CLI, and Gemini Spark 24/7 background orchestration.
- **android/ (NDK & Low-Level OS Integration)**: ASharedMemory zero-copy allocations, UNIX socket FD passing via SCM_RIGHTS, AndroidManifest.xml :process isolation, startForeground / START_STICKY LMK mitigation, and the Media/Accessibility APIs for Æsc and Æyre.
- **models_and_apis/**: Gemma 4 12B (Node Beta), Gemma 4 E4B, Gemini Nano (Chrome on-device), Gemini API / AI Studio, and NotebookLM (notebooklm-py).
- **credits_and_iam/**: \$1,000 Vertex AI developer credit routing, asymmetric cross-account IAM handshake (roles/storage.objectViewer binding for Discovery Engine service account), and business vault isolation.

2. Qualcomm Ecosystem (vendors/qualcomm/)

- **qairt_sdk/**: QAIRT SDK headers, compile-time tooling, Hexagon v79 / v73 HTP limits, FastRPC ioctl definitions, and libQnnHtp.so bindings.
- **runtime_and_models/**: GenieX GGML backend, pre-compiled Genie bundles from QAI Hub, and Qualcomm-hosted model exports (Qwen 3.5 0.8B, LiteHRNet, Phi-4-Mini).
- **hardware_and_quantization/**: FraQAT / QAT (Quantization Aware Training), 40+ INT8 TOPs execution profiles, and the 3.5GB Process Domain (PD) virtual multi-device layer-splitting model.

3. GitHub Ecosystem (vendors/github/)

- **owned_repos/**: Your core c10vis-poem repositories (novae-xorpus, aesop-xi, openwiki fork, claude-code-android, OB1, ECC-aesop).
- **forked_and_watched/**: Upstream dependencies and forks (Anthropic MCP servers, Prime Agent RLM, Graphify Labs AST, obsidian-skills, mattpocock/skills).
- **ci_cd_and_actions/**: GitHub Actions automated build workflows, APK compilation runners, and Docker containerization scripts.

This dedicated vendor structure ensures that all Google Cloud/Android documentation, Qualcomm HTP specs, and GitHub repo records have their own first-class directories instead of being crammed into generic folders.

Do you want this 3-vendor hierarchy established in the mirror first so we can begin compiling the raw vendor files into their respective trees?
