

"One Skill to Rule Them All" (also known as task-observer) is a meta-skill configuration file, not a standalone software harness or an MCP server. [1, 2]

It is a modular **behavioral rule engine**. Instead of writing code or connecting to a database, it defines a persistent set of instructions that teaches Claude *how* to monitor its own performance, watch your habits, log errors, and dynamically optimize its own rules over time. [1, 3]

How it Works Under the Hood

The easiest way to understand the difference is to see exactly what each layer handles in your project setup:

-
- **The Interface (CLI TUI): Claude Code** (anthropics/claude-code). This is the terminal execution loop you actively interact with. You do not replace this with any other CLI wrapper. [4]
- **The Data Connectors (MCP): MEM0 and Terrestrial Brain**. These act as backend plugins. They give Claude raw programmatic access to search your short-term logs and read your static Obsidian corpus. [5]
- **The Behavioral Guardrail (Skill File): Honey for Devs**. This is an instruction sheet telling Claude to write compact code and serialize everything via ESON. [5]
- **The Self-Improving Supervisor (Meta-Skill File): One Skill to Rule Them All (task-observer)**. This is an overarching, meta-level markdown rule file. It acts as a passive supervisor watching every command. If Claude uses too many tokens, hallucinates a file path, or ignores a rule, the task-observer logs the slip-up in your repository and builds a staged proposal to correct it. [1, 2]
-

How it Integrates with Your Layers

You don't install it using Python or configure it in an MCP JSON bracket. Because it is a markdown-based skill framework, you configure it inside your **.claudecode.md** or **CLAUDE.md** workspace file right at your repo root: [6]

1. **You drop your fork** into your project's skill directory path (.claude/skills/task-observer).
2. **You add the activation sentence** to your root CLAUDE.md file.
3. When you run claude, Claude reads that sentence, wakes up the task-observer logic, and runs your other layers (MEM0, Terrestrial Brain, Honey) under its supervised eye. [2, 4, 6]

Would you like me to write out the clean **CLAUDE.md setup file** that stitches your task-observer fork instructions together with your Honey behavior, or do you want to verify that Claude Code is reading your **.claude/skills subfolder** correctly?
