

_dumbass_universal_memory — Decoupled Persistent Memory Core

System Role & Authority

Central cross-service persistent memory backbone connecting SQLite FTS5, PostgreSQL + pgvector (OB1 / Terrestrial Brain), Mem0 episodic storage, Reasoning Bank, and the OmniRoute Port 20128 asynchronous tap.

Architecture & Subsystems

- **mem0/**: Fast episodic context cache, session variables, habit tracking, and user preferences.
- **ob1_postgres/**: Static Terrestrial Brain database schemas and pgvector long-term invariants.
- **reasoning_bank/**: Active execution pathways and multi-agent plan graphs.
- **sqlite_fts5/**: Local fast Code Review Graph (CRG) AST symbol indices and blast-radius caches.
- **omniroute_tap/**: Gateway interceptor on Port 20128 performing asynchronous prompt/response stream extraction.
- **archive/**: Historical traces and compacted memory snapshots.

Multi-Tier Memory Flow

1. **Read Phase**: Query Mem0, Terrestrial Brain, and CRG before execution.
2. **Write-Back & Compaction**: Commit short-term variables to Mem0, permanent truths to Terrestrial Brain.
3. **Obsidian Vault Sync**: Mirror static memory events to **/vault/memories/** with clean UUID/timestamp frontmatter.
