

**Xçineribus, in-variis-nunquam-varius,
Novi-Æxentis-Copiæ, Vincent**

(From the ashes, unwavering in the midst of adversity, new forces of abundance conquer)

Æsc🌱et🦁Æyre

Using ae for URLs, repositories, and package names is standard developer reality. It actually creates an awesome double-life for your app: it is **novaexopia** and **novus-aexenti** under the hood in the code, but becomes **NovÆxopia** and **NovusÆxenti** the moment it hits the UI.

NovusÆxenti -Agent logic

NovÆxopia - “Claw” harness

**Æsop-Xi - ethical agent orchestiom layer
(Agentic execution split operations protocols)**

ransmuting to the UI (The ASCII Trick)

When the code serves data to your Horizons UI frontend, you can use the standard Unicode character \u00C6 (for upper-case Æ) or \u00E6 (for lower-case æ) in your string resources.

Because Android UI layouts support crisp vector rendering, you can pick a font for your app splash screen where the Æ looks razor-sharp.
