

Termux Assets (on RAZR)

****Real and relevant, keep:****

1.- `processor\_config.json` —

A **Gemma4AudioFeatureExtractor** config (mel spectrogram params, 128 features, 750 seq length).

This is the actual audio-preprocessing config for the multimodal Gemma 4 models you have — ties directly to `gemma-4-12B-it-qat-UD-Q4\_K\_XL.gguf` / `gemma-4-E2B-it-qat-UD-Q4\_K\_XL.gguf` / `mtp-gemma-4-E2B-it-BF16.gguf`. Needed if you ever run their audio branch.

2. **`http\_backend\_ext\_config.json`** — a real **QNN HTP backend config** (vtcm_mb, dsp_arch, perf_profile: burst). Note: `dsp\_arch: "v73"` — **this phone's actual NPU is ***v79***** (confirmed from the Paage.ai APK teardown earlier). This config is for an older Hexagon generation; would need updating before reuse on this device.

3. **`mcp.json`** — a real *MCP server config* for an **`agentmemory` server via npx**. Small, usable as-is.

4. **`quickstart.md` / `usage.md`** — real **docs for ***OpenWiki*****, your own TypeScript CLI (matches your `c10vis-poem/openwiki` fork) — **a repo-documentation agent tool**.

5. **`INSTRUCTIONS.md`** — real **doc-writing instructions for the *`Novus-Agenti`* wiki project**.

6. **`gemini-code-1787813090295.json`** — a **structured skill record for "Grill-Me Architectural Interview Harness"** targeting your Prime-agent runtime — metadata, not code, but legitimate.

.
