Termux App Store – TUI & CLI Package Manager for Termux

The first offline-first, binary-safe TUI package manager built natively for Termux on Android.

Read in: Bahasa Indonesia | ภาษาไทย | 日本語 | 中文 | Tiếng Việt | हिन्दी

CI passing codecov 100% pypi v0.4.5 release Termux-App-Store v0.4.5 downloads 942 License MIT stars 96 forks 16

Offline-first • Binary-safe • Source-based • Termux-native • Android Terminal Install and manage Termux packages — pre-built binaries or source builds — no root, no account, no telemetry.

What is Termux App Store?

Termux App Store (`termux-app-store`) is a **TUI (Terminal User Interface)** and **CLI package manager** built with Python ([Textual](#)) that lets Termux users on Android **browse, install, and manage tools/packages** directly on-device — no account, no telemetry, no cloud dependency, no root required.

Starting from **v0.4.0**, Termux App Store supports a **fast install engine**: packages are downloaded as pre-built `.deb` binaries from a mirror pool (GitHub Pages, Cloudflare CDN, jsDelivr), with local `.deb` caching (TTL 7 days) and per-arch SHA256 verification. Source builds remain available via `fix-install` for full control.

It works as an **alternative package manager for Termux**, letting you install community tools using verified `build.sh` scripts — similar in spirit to the AUR (Arch User Repository) but designed specifically for Termux on Android.

How is this different from `termux-packages` or **TUR (Termux User Repository)**?

- `termux-packages` is the official Termux repo — maintained by the core team, requires PR approval, and only accepts widely-used tools.
- TUR is a curated extension, still requires contributor review.

- **Termux App Store** is fully community-driven: anyone can submit a `build.sh`, packages are distributed as pre-built `.deb` or source builds, and there is no centralized approval gate. Think of it as a personal + community package layer on top of Termux.

 Important

Termux App Store is **not a hidden auto-installer**. All installs — binary or source — run **locally, transparently, and under full user control**.

 Who Is It For?

User	Use Case
Termux Users	Fast binary installs or full source-build control
Developers	Distribute tools via pre-built <code>.deb</code> or source packaging
Reviewers & Auditors	Review and validate build scripts
Maintainers	Manage multiple Termux packages at once

🔗 Quick Install and Uninstall

Available on [PyPI](#) — searchable and indexed, easy to discover.

🔗 Option 1 (Recommended)

```
pkg install python
pip install termux-app-store
```

🔗 Option 2 (Manual)

Simple (recommended if memory is limited)

```
curl -fsSL https://raw.githubusercontent.com/djunez/termux-app-store/master/tasctl | bash -s install
```

With git clone (downloads full repository)

```
git clone --single-branch --branch master https://github.com/djunez/termux-app-store
cd termux-app-store
bash install.sh
```

After install, run:

```
termux-app-store      # Open interactive TUI
termux-app-store -h    # Show CLI help
tas                   # Shorthand for termux-app-store
```

🔗 Uninstall

```
pip uninstall termux-app-store
# or
./tasctl uninstall
```

🔗 Usage

🔗 TUI — Interactive Interface

```
termux-app-store
# or shorthand:
tas
```

🔗 CLI — Direct Commands

termux-app-store list	# List all packages
termux-app-store show <package>	# Show package details
termux-app-store install <package>	# Fast install (pre-built .deb)
termux-app-store install pkg1 pkg2 pkg3	# Multi-package install
termux-app-store fix-install <package>	# Force source build (bypass fast install)
termux-app-store search <query>	# Search packages by name or description
termux-app-store update	# Check for available updates
termux-app-store upgrade	# Upgrade all packages
termux-app-store upgrade <package>	# Upgrade a specific package
termux-app-store uninstall <package>	# Uninstall a package
termux-app-store mirrors	# Check mirror status
termux-app-store cache info	# Show binary cache info
termux-app-store cache clear	# Clear binary cache

```
termux-app-store version      # Check latest version
termux-app-store help        # Full help
```

Features

Package Browser (TUI) Browse packages from the `packages/` folder interactively with keyboard & touchscreen navigation.

Fast Install Engine Downloads pre-built `.deb` from mirror pool — GitHub Pages, Cloudflare CDN, jsDelivr — with automatic fallback.

Binary Cache Local `.deb` cache with 7-day TTL and per-arch SHA256 verification. Cached packages install instantly.

Smart Build Validator Detects unsupported Termux dependencies with automatic status badges.

Real-time Search & Filter Search packages by name or description — `search / find` CLI commands included.

Multi-package Install/Uninstall Install or remove several packages in one command with a summary output.

One-Click Manage Install / update / uninstall Termux App Store itself via `./tasctl`.

Privacy-First No account, no tracking, no telemetry — fully offline after mirror sync.

Package Status Badges

Badge	Description
NEW	Newly added package (< 7 days)
UPDATE	A newer version is available
INSTALLED	Installed version is up-to-date
UNSUPPORTED	Dependency not available in Termux

How Fast Install Works (v0.4.0+)

If fast install fails, use `fix-install <package>` to force a full source build via `build-package.sh`.

Adding a Package

Every package in Termux App Store is defined by a single `build.sh` file — similar to how PKGBUILD works in Arch Linux, but adapted for Termux on Android.

Every package **must** have a `build.sh` file:

```
packages/<tool-name>/build.sh
```

Minimal build.sh Template

```
TERMUX_PKG_HOMEPAGE=""
TERMUX_PKG_DESCRIPTION=""
TERMUX_PKG_LICENSE=""
TERMUX_PKG_MAINTAINER="@your-github-username"
TERMUX_PKG_VERSION=""
TERMUX_PKG_SRCURL=""
TERMUX_PKG_SHA256=""
```

Note

See the full template in `template/build.sh` or run: `./termux-build template`

Adding a Package using termux-build

```
cd termux-app-store
./termux-build create your-tool-name
# or auto-create from a GitHub URL:
./termux-build init https://github.com/user/repo
```

Note

When naming, do not use spaces — use `-`. Example: `my-tool-name`

termux-build — Build & Validation Tool

`termux-build` is a validation and reviewer helper tool — not an auto-upload or auto-publish tool.

```
./termux-build create <package>      # Create package for distribution
./termux-build init <url-repo>        # Auto-create and build package from GitHub URL
./termux-build lint <package>        # Lint a build script
./termux-build check-pr <package>    # Check PR readiness
./termux-build doctor                # Diagnose environment
./termux-build suggest <package>     # Get improvement suggestions
./termux-build explain <package>     # Detailed package explanation
./termux-build template              # Generate build.sh template
./termux-build guide                 # Contribution guide
```

Note

`termux-build` **only reads and validates** — it does not modify files or upload to GitHub.

tasctl — Termux App Store Controller

`tasctl` is the controller for the `termux-app-store` system.

```
./tasctl install      # Install Termux App Store (latest)
./tasctl update        # Update to latest version
./tasctl uninstall    # Remove Termux App Store
./tasctl doctor        # Diagnose environment
./tasctl self-update   # Update tasctl itself
./tasctl help          # Show help
```

guidebook — All Information About Termux App Store

`python guidebook.py`

Note

guidebook currently supports two languages: English and Bahasa Indonesia.

How to Distribute Your Package to the Termux Community

```
# 1. Fork this repo
# 2. Add your package folder:
mkdir packages/your-tool-name
# 3. Create build.sh from the template or with termux-build:
./termux-build create your-tool-name
# or from a GitHub URL:
./termux-build init https://github.com/you/your-repo
# 4. Validate with termux-build:
./termux-build lint packages/your-tool-name
# 5. Submit a Pull Request
```

Security & Privacy

Security	Privacy
No extra permissions required	No account or registration
No network ports opened	No analytics or tracking
No background services running	No telemetry of any kind
Builds only run on explicit user command	Offline-first by design
SHA256 verification on all .deb downloads	Binary source is transparent and auditable

BINARY_DISCLAIMER	Notes on binary distribution

🔗 Philosophy

"Local first. Control over convenience. Transparency over magic."

Termux App Store is built for users who want to:

- Fully understand what runs on their device
- Control builds and sources directly
- Avoid vendor lock-in and cloud dependency
- Share tools openly with the Termux community

🔗 License

This project is licensed under the **MIT License** — see [LICENSE](#) for details.
