✓ SKILL.md in the open agentskills.io standard — works directly in Claude, ChatGPT/Codex, Cursor, Copilot & more.

Happy Ending is an AI skill for closing AI work sessions cleanly, turning the chat into the valid project state: final decisions, open tasks, a memory patch and a copy-paste next-session prompt. Its core is a Memory Safety layer, so discarded, canceled or superseded work is not mistakenly saved as the valid state.

WHAT THIS SKILL DOES

- Extracts final decisions, open tasks, learnings and discarded points from the session
- Protects your memory: canceled, reverted or superseded work is not saved as the valid state (Memory Safety)
- Emits a memory patch (Add/Update/Ignore) instead of blind-rewriting whole memory files
- Separates "don't adopt" (Do Not Carry Forward) from "don't try again" (Do Not Repeat)
- Delivers a directly pasteable next-session prompt plus a compact Delta block
- Suggests commit messages and commit groups for code — but executes nothing unasked
- Two depths: Quick (compact default) and Deep (on request)

DESCRIPTION

Happy Ending is a skill for closing AI sessions — it turns a messy chat into a clean, reusable project state instead of a novel. Guiding line: Happy Ending doesn't save everything that happened, it secures what holds from now on. It runs in three phases (Look Back → Clean Up → Kiss Goodnight) and picks up final decisions, open tasks, learnings, user corrections, references and discarded points. Out of that comes a compact report: Result, Decisions, Open, Do Not Carry Forward, Do Not Repeat, a Memory Patch (Add/Update/Ignore), file/git notes when relevant, the single next best step, a directly pasteable next-session prompt, a Delta block (+ ~ – !) and a short closing line with counters. The core feature is the **Memory Safety layer**: every point gets a status (final, open, tentative, reverted, canceled, superseded, rejected, do-not-repeat, do-not-carry-forward, unclear) and a confidence — only final + high (or your explicit confirmation) may enter long-term memory. A reversal detector watches for undo signals ("actually no", "canceled", "take that out"), when the session contradicts itself the last confirmed state wins (final-state-wins), and instead of blind-rewriting whole memory files the skill emits a patch. Git and files are only ever suggested — Happy Ending never commits, pushes, deploys or overwrites without your explicit instruction. Two depths: Quick as the compact default, Deep on request.

EXAMPLES

Close the session quickly

Wrap up the session.

You  August 31, 2026

Happy Ending

Happy Ending

Result

Landing-page hero copy and the primary CTA are settled. One asset is still open.

Decisions

- [final · high] Hero headline: "Ship faster, guess less."
- [final · high] Primary CTA: "Start free" (secondary "See how it works").

Open

- [open] Export the hero background as WebP (1600px).

Do Not Carry Forward

- The purple-gradient hero — dropped mid-session, don't reintroduce.

Memory Patch

+ Add

- Preference: CTA voice is plain-imperative ("Start free"), not "Get started now".

...

WHAT IT DOES NOT DO

- Not a chat summary and not a chronological retelling — it secures the valid state
- Not an auto memory-dump — only final + high (or your confirmation) is saved for good
- Never commits, pushes, deploys or overwrites without an explicit instruction — it suggests
- Not a full project-management system and no substitute for tests, review or release
- Doesn't impose a memory layout — it patches your real memory (CLAUDE.md, a memory folder, Cursor rules ...)

COMPATIBILITY & TECH

Claude

ChatGPT/Codex

Cursor

Copilot

Gemini CLI

Windsurf

Cline

Tested (internal)

4 scenarios

Recommended runtime

Claude Opus or Sonnet; with git/file access for commit/file suggestions, otherwise pure copy-paste suggestions

Modes

Quick (default) · Deep · Handoff · Git suggestion (optional) · Skill notes (optional)

Inputs

The session's chat history · Git status (optional) · Existing project memory (optional)

Output format

Compact Markdown report: Result · Decisions · Open · Do-not lists · Memory Patch · Next-session prompt · Delta · Closing line

SECURITY PROFILE

✓ Local

Runs entirely on your machine with your own AI — no external runtime, no running costs.

✓ Instruction-only

Only instructions, templates and references — no executable scripts.

✓ No network access

Works offline with what you provide — does not call external services on its own.

    📄 SKILL.md
    📄 manifest.json
  > 📁 references/  3 files
    📁 .agents/skills/happy-  → universal — same content (Codex, Cursor, Copilot, Gemini,
      ending/                Windsurf, Cline)
    📄 LICENSE.txt
```

INSTALLATION

After unlocking, you install with a single command — it auto-detects your AI tool.

Runs in

Claude Code

GitHub Copilot

Gemini CLI

Cursor

Codex CLI

Windsurf

Cline

ALSO WORKS AS A CHAT PROMPT

Full in chat

No AI tool? Paste it into Claude, ChatGPT or Gemini and use the method right away.

This skill ships no scripts, so the prompt carries its full method.

Installing is the full version — it triggers automatically, runs its scripts and loads references as needed. As a chat prompt you drive the method by hand.

Unlock to copy the ready-to-paste prompt — then in "My Skills".

REVIEWS

★★★★★ 5.0 1 review

NOTE

Start it manually by default ("make a Happy Ending" or "/happy-ending"). The skill only suggests memory, git and file changes — it saves, commits or overwrites nothing without your explicit approval. When the final state is unclear, it asks one short question instead of guessing.

CHANGELOG

v1.0.0 07.07.2026

Initial release: three-phase session close (Look Back → Clean Up → Kiss Goodnight) with a Memory Safety layer (status + confidence, reversal detector, final-state-wins, patch-not-rewrite), separate Do Not Carry Forward / Do Not Repeat, a memory patch, a copy-paste next-session prompt, a compact Delta block and a closing line. Two depths (Quick/Deep) + optional Git/skill blocks; git and files are only ever suggested. References for templates, memory-safety and examples.

FREQUENTLY ASKED QUESTIONS

What does Happy Ending do?

Happy Ending is an AI skill for closing AI work sessions cleanly, turning the chat into the valid project state: final decisions, open tasks, a memory patch and a copy-paste next-session prompt. Its core is a Memory Safety layer, so discarded, canceled or superseded work is not mistakenly saved as the valid state.

How do I close an AI session cleanly?

Is Happy Ending just a summary?

How does Happy Ending keep wrong entries out of memory?

Can Happy Ending commit or push?

What's the difference between Do Not Carry Forward and Do Not Repeat?

Which AI tools does Happy Ending work with?

How do I use Happy Ending?

Works well with

Deep Research

Deep research that doesn't stop at the third hit: search broad, hunt primary sources, cross-check, show contradictions, cite cleanly. Neutral — it reports sources and how strong they are, never a true/false verdict.

AI Blueprint Assistant

Turn a rough idea into an AI-ready project plan and AGENTS.md handoff — for software AND everything else.

Decision Board

Stress-test your decision before you commit — a structured panel of experts, stakeholders and critical counter-voices that argue it out, so you get a real second opinion instead of one answer.

Code Reviewer Pro

Senior code review line by line: bugs, security, missing tests — with concrete fixes and a clear verdict.

The marketplace for ready-made AI skills & agents.

Pick, install, deploy.
