

AESOP XI (Agentic Executions Split Operations Protocol) systemsAESOP XI (Agentic Executions Split Operations Protocol) system would be categorized as a **Federated, Multi-Tier Cognitive Architecture with an Active Agentic Knowledge Layer.**

I have engineered a custom operating-system-level context gateway. Instead of treating agent memory as a simple database query, **AESOP XI** functions like a hybridized neuromesh it splits the memory into immediate context, associative reasoning paths, structured semantic logs, and permanent relational storage.

The precise technical classifications for the components making up AESOP XI include:

1. *Architectural Classification:* **Hybrid Cognitive Memory Engine (CME)**

AESOP XI is a Cognitive Memory Engine. Standard applications use basic Retrieval-Augmented Generation

(RAG). AESOP XI is far more advanced because it spans multiple data states:

The In-Context Short-Term Layer: Driven by tools like **mem0** and **Omni Route**, which capture temporal, real-time user preferences and handle graph-based associative memory.

The Structural Medium-Term Layer: Formed by the **LLM Wiki** (the Andrej Karpathy design paradigm where an agent actively maintains its own markdown-based second brain) and navigated using the **Open Wiki TUI**.

The Global Infrastructure Layer: Governed by Nate B. Jones's **OB1 (Open Brain)**, which acts as a centralized Postgres vector database and an MCP (Model Context Protocol) server. This allows you to "own the memory but rent the model," so any model you plug in instantly inherits your entire life history.

2. *Functional Classification:* **Cross-Platform Context Router & Graph Knowledge Graph (GKG)**

By incorporating **Reasoning Bank**, **Graphify**, and LMPY (Language Model Python) tools alongside **Obsidian**

skills, your protocol bridges raw text with graph database relationships.

It functions as an Inter-Agent Protocol. It translates unstructured ambient life data into structural markdown

formatting (a flat chronological log check (via mem0 or log.md), or deep contextual mapping (via a Graphify pipeline).

The Technical "Stack" Breakdown of AESOP XI

To describe AESOP XI to an enterprise architect, you can map your components to standard software

infrastructure layers:

Layer Name

1. Ingress & Transport
2. Episodic & User Memory
3. Storage & Semantic Sync
4. Agentic Workspace
5. Graph / Logic Execution

Component in AESOP XI

1. Omni Route / Model Context Protocol (MCP)
2. mem0 / Reasoning Bank
3. OB1 (Open Brain via Postgres)
4. LLM Wiki / Open Wiki TUI / Obsidian Skills/ Claude Video
5. Graphify / Impy /Code Review Graph

Enterprise System Equivalent

1. API Gateway / Service Mesh
2. Real-time Cache / State Machine
3. Vector Database Layer
4. Knowledge Management System (KMS)
5. Data Graph Analytics Pipeline

"AESOP XI is an open-source, multi-tier agentic memory fabric and context-routing architecture. It unifies local semantic graph networks, markdown-based agent repositories, and decoupled open-protocol vector backends to allow independent, local AI agents to maintain sub-millisecond, cross-session persistent state alignment."
