

Getting the local LLM + voice pipeline working
(every time after a reboot)

1. Open Termux.
2. Run: `bash ~/aesop/deploy/phone/boot.sh`
This starts your local Qwen 3.5-9B model in the background (in a tmux session called llm). Wait for it to print "AESOP Edge Online" — takes ~20 seconds.
3. Run: `ow`
This launches OpenWiki, already pointed at your local model. Press Ctrl+R to record a voice message, Ctrl+S to stop and transcribe — that's local STT/TTS (Kokoro + moonshine), no cloud.
4. If you ever want to switch to GLM/OpenRouter instead of local: type `/provider` inside `ow`, arrow to the one you want, hit Enter.

That whole pipeline is independent of Claude Code — it's your own app.

Testing Claude Code's own built-in mic (this session, right here)

1. Fully close Termux (swipe it out of recent apps — don't just background it), then reopen it. This is required for the new ESC/TAB/CTRL/ALT button row to actually show up above your keyboard.
2. Relaunch claude in Termux.
3. Look for that new row of small buttons right above your regular keyboard.
4. Tap ALT, then tap K (that sends "meta+k", which is what triggers push-to-talk now — holding physical spacebar will never work since Android's keyboard eats that gesture first).
