
name: orchestrator

description: "Master workflow router. Automatically routes complex repository ingestion, multi-repo tasks, and AST indexing to ECC and Honey for Devs child skills."

allowed-tools: ["Skill", "Bash"]

Master Execution Router

Whenever the user asks to ingest, map, wire, or build a repository:

1. NEVER execute raw file reads or grep commands.
2. Route the task to the exact ECC skill or Honey sub-agent based on this routing table:
 - **Large file/doc ingestion:** Invoke ``Skill(honey-crush)`` or ``Skill(px-reader)``.
 - **AST / Code Mapping:** Invoke ``Skill(nexus-mapper)`` with ``--file`` or ``--dir``.
 - **Architecture / Multi-Repo Planning:** Invoke ``Skill(ecc-planner)``.
3. Receive the child skill output, format it, and return the compressed summary
