

You are right. That compact summary stripped out the actual scope.
The complete, federated architecture codified across
[05_FEDERATED_FILE_TREE_TOPOLOGY_MASTER.md](#),
[02_DUMBASS_UNIVERSAL_MEMORY_SPEC.md](#), and
[03_DUAL_OPERATIONAL_HARNESS_AND_MCP_SPEC.md](#) is significantly more expansive.
Here is the complete picture of all the interconnected pieces that make up the system:

1. The Federated Repositories & Pointer Checkouts

Beyond the core subsystem folders, the architecture tracks the 5 active checkout repositories:

1. **OmniRoute** (c10vis-poem/OmniRoute): Unified AI Gateway and primary memory extraction layer on localhost:20128.
 2. **NovA-prime-agent** (c10vis-poem/NovA-prime-agent): Mode B on-device execution harness running the RLM loop with a persistent Python REPL.
 3. **Novus-OpenBrain (OB1)**: Static ground-truth knowledge base and Postgres vector protocol accessed over MCP.
 4. **Novus-WhisperKitAndroid**: Bare-metal on-device audio transcription and streaming voice stack.
 5. **NovA-browser-use**: Headless browser automation engine for UI-driven workflows.
- *Plus:* **TERMUX-PACKAGES** (Custom NDK toolchain) and the core repos (novaexopia, novus-aexenti, aesop-xi, data_vault, vendor-corpora, tools).

2. Universal Scripts & Skill Extraction Layer

Located across tools/ and 04_skills_runtime/:

- **doc_to_skill_and_tool.py**: Dual-extraction engine parsing raw documentation into procedural skills (SKILL.md) and executable tools (.sh / .py).
- **compile_manifest.py**: Universal SHA-256 cataloger generating hierarchical manifest.jsonl registries.
- **convert_raw_to_markdown.py**: Document normalizer converting messy notes and docx into clean Markdown with YAML frontmatter.
- **generate_jsonl_markers.py**: Tokenized chunk generator populating the high-speed machine retrieval cache.
- **npu_manager.py**: UNIX domain socket daemon managing Snapdragon Hexagon v79 NPU model swaps.
- **system_housekeeper.sh**: Zero-trust boundary auditor validating symlinks, Git hooks, and unindexed files.
- **export_drive_docs.js**: Headless Google Apps Script exporting Docs directly to Markdown and JSONL.
- **log_builder.py**: Episodic telemetry engine appending run traces to agent_logs.jsonl.
- **boot.sh**: Post-reboot automated shell boot sequence (boot.sh → tmux llm → openwiki).

3. MCP Server Infrastructure (mcp_connectors/)

- **Filesystem MCP** (@modelcontextprotocol/server-filesystem): Node.js stdio bridge for local filesystem operations.
- **SQLite MCP** (sqlite_mcp.py): Zero-latency, on-device key-value and session state lookups.

- **PostgreSQL MCP** (postgres_mcp.json): Grounded vector persistence and OB1 queries over the Tailscale mesh to Node Beta.
- **GitHub MCP**: Native repository commit, issue, and branch management.

4. System Hooks & IPC Bridges

- **ADB Loopback Hook**: WirelessAdbBridgeService.kt maintaining local loopback on 127.0.0.1:5555 with UID 2000 shell privileges.
- **UNIX Domain Sockets**: Direct inter-daemon IPC (/dev/socket/npu_manager.sock, /dev/socket/aesc_shell.sock).
- **WebSocket Channels**: Live streaming connections (ws://127.0.0.1:8080/shell for terminal I/O, ws://127.0.0.1:8765/media for real-time audio and VAD events).
- **Git Post-Commit Hooks**: Automated triggers running regenerate_masters.sh to update manifest hashes across child repos.

5. Modular Agent Setups & Harnesses

- **Mode A (Developer Terminal)**: Claude Code CLI governed by ECC (Everything Claude Code) with Matt Pocock's engineering skills (grill-me, spec, ticket, tdd, code-review).
- **Mode B (Sovereign Edge Assistant)**: Prime Agent managing on-device weights on the Hexagon NPU via Continual Harness.
- **Mode C (Hybrid Delegation)**: Prime Agent invoking Claude Code as a discrete subprocess tool call without nested harness wrapping.
- **Mode D (Audit & Telemetry)**: The public Cross-Auditor aggregating session traces on Node Beta.
- **Dedicated Personas**: Æræcle (help-desk oracle), File Administrator (OpenWiki repo cleaner), Early-Trend Scraper, and the IT Helpdesk agent.
- *(Red Auditor remains strictly isolated in its sealed .incognito_red_sandbox/, completely hidden from all public repos).*

6. The 7-Cut Living Wiki Hierarchy (data_vault/02_wiki_md/)

Detailed in [MASTER_WIKI_LAYOUT_PROPOSAL_V2.md](#):

- 1_repos/ — Detailed profiles and manifests for all 100+ repos and checkouts.
- 2_ast_graphs/ — Structural AST dependency maps generated by Graphify.
- 3_permissions_and_security/ — OS manifests, ADB privileges, and tool execution guardrails.
- 4_scripts_and_tools/ — Documentation for daemons, cleaners, and converters.
- 5_hardware_and_silicon/ — Hardware contracts for Snapdragon 8 Elite, Jetson Orin Nano, and Rubik Pi 3.
- 6_data_contracts_and_schemas/ — SQLite DDLs, Postgres schemas, and JSONL specs.
- 7_concepts/ — Theoretical frameworks, RLVR training loops, and Continual Harness adaptation.

All of these specifications, maps, and tools are archived in the mirrored folder:
