

MASTER HOOKS REGISTRY — NovÆxorpus Ecosystem

Authority: Authoritative specification and catalog for all Git lifecycle hooks, continual learning feedback loops, and cross-repository synchronization hooks across the NovÆxorpus ecosystem.

1. Operational Invariants for Hooks

- Automated Manifest Regeneration:** Any write operation to `clean_md/`, `wiki_md/`, `skills/`, or `tools/` fires post-commit manifest generation.
- RLVR Evaluation Hooks:** Ingestion passes must trigger verification hooks (`tools/check.py`) using disjoint extractors prior to catalog commit.
- Cross-Repo Sync Protocol:** Synchronizes `#d.u.m.b.a.s.s.` authoritative memory structures across consumer repositories (`aesop-xi`, `novus-aexenti`) without recursive duplication.

2. Master Hooks Catalog

Hook Name	Hook Location	Trigger Event	Action / Script Bound
<code>post-commit</code>	<code>~/.git/hooks/post-commit</code>	Git Commit in any repo	Triggers <code>compile_manifest.py</code> & <code>generate_jsonl_markers.py</code>
<code>pre-commit-hygiene</code>	<code>~/.git/hooks/pre-commit</code>	Git Commit	Runs <code>system_housekeeper.sh</code> & checks for <code>.red/</code> leakage
<code>rlvr-verifier</code>	<code>novae-xorpus/hooks/</code>	Ingestion / Normalization	Dispatches <code>corpus-verify</code>

Hook Name	Hook Location	Trigger Event	Action / Script Bound
			check across source vs clean
continual-rollback	novae-xorpus/hooks/	Skill execution error	Reverts snapshot to previous verified checkpoint
dumbass-cross-sync	aesop-xi/.git/hooks/	Post-commit in consumer repo	Synchronizes memory markers to novae-xorpus
