

Novaexopia Subsystem Specification & Runbook

Overview

``novaexopia`` is the execution harness runtime and capability bridge for the NovÆxopus ecosystem. It provides the execution shells, agent swarms, and external tool connectors.

Core Architectural Components

1. **OpenWiki TUI Harness (``openwiki-tui-harness/``)**:
 - Terminal user interface and interactive text dashboard.
 - Grounded in OpenWiki specs and mobile developer workflows.
2. **Modular Swarm Harnesses (``modular_harnesses/``)**:
 - ``ecc-edge-compute/``: Edge computing loop and Claude Code CLI interface.
 - ``prime-agent/``: Sovereign-edge on-device RLM loop with persistent Python REPL.
 - ``ringer-notif-loop/``: Notification interceptor and event loop.
 - ``hermes-soul/``: Hermes CLI integration.
 - ``aider-workspace/``: Automated coding agent harness.
 - ``local-nanobots/``: Lightweight local task runners.
 - ``smol-agents/``: Minimalist functional agents.
 - ``turbo-quant-swarms/``: Fast quantized model swarm orchestration.
3. **MCP Connectors (``mcp_connectors/``)**:
 - Standardized Model Context Protocol bridges to local filesystems, databases, and external endpoints.

Operational Invariants

- **First-Move Directive**: Orient with ``MAP.md``, query ``manifest.jsonl``, load targeted files only.
- **Locality of Reference**: Skills and tools live locally where they are applied.
- **Hot-Swap Design**: Decoupled interfaces (Model, Memory, Tools, Output) enable swapping harnesses without state corruption.
