

Nov/Æxorpus Universal Repository Mirror & Subagent Ingestion Spec

****Scope****: Standardized repository layout, mirror skeleton, and worker agent ingestion contracts across the federated ecosystem.

****Direct Download Archive****:

1. Federated Repositories Mirrored

1. ****`aesop-xi`****: Universal orchestration, arbitration, and behavioral policy governance.
2. ****`novus-aexenti`****: Cognitive MoE reasoning engine (0.8B Triage vs. 9B Executor), in-session mem0 episodic memory, and Reasoning Bank flywheel.
3. ****`novaexopia`****: Native 3-APK framework (Horizons UI, Æsc terminal daemon, Æyre media daemon), MCP connectors, and execution harnesses.
4. ****`data\_vault`****: Living LLM Wiki (Karpathy standard), raw data landing buckets, pre-tokenized RAG shards, and episodic audit telemetry.
5. ****`vendor-corpora`****: Qualcomm QAIRT, Snapdragon 8 Elite Hexagon v79 HTP FastRPC specs, and Android NDK bindings.
6. ****`tools`****: Cross-subsystem production utilities and boundary sweepers.

2. Universal Subsystem Directory Layout (Inside Every Repo)

Each repository follows this exact structure:

...

```
<repo_name>/
|— MAP.md           # Human-readable navigation map & component ontology
|— manifest.jsonl   # Local cryptographic file index & RAG catalog
|— README.md        # Subsystem setup, scope, and operational identity
|— AGENTS.md        # Operational boundaries, agent contracts, and invariants
|— RESUME.md        # Active state tracker & progress checkpoints
|— chunk.jsonl      # Pre-tokenized machine retrieval & RAG passage layer
|
|— raw/             # Incoming source landing zone (Interceptor extracts here)
|— clean_md/        # High-density condensed markdown (build context preserved)
|— wiki_md/         # Compounding living LLM wiki nodes with wikilinks
|— skills/          # Local procedural skills developed and applied here
|— tools/           # Local executable Python/bash tools and wrappers
```

```
|— pending/      # Staged tickets, backlog tasks, and unverified outputs
|— audit/        # Structured logs, failure traces, and divergence reports
...

```

Crucial Invariant: The Red Auditor agent is completely absent from all public trees and lives strictly in a sealed, private sandbox.

3. Worker Agent / Subagent Ingestion Contract

When a subagent or worker agent is assigned to populate a repository from the raw corpus:

1. **Input**: Raw documents land in ``raw/``.
2. **Dual Extraction**: The agent scans for:
 - Procedural heuristics, workflows, and prompts → Saved as ``md`` inside ``skills/``.
 - Executable scripts, CLI flags, and code blocks → Saved as standalone ``py`` / ``sh`` inside ``tools/``.
3. **Condensation**: The source is rewritten into ``clean_md/``:
 - **No 1:1 file parity rule.** Fat, boilerplate, and conversation filler are stripped.
 - 100% of technical instructions, parameters, and architecture context must survive intact.
4. **RAG Indexing**: Key passages are pre-tokenized into ``chunk.jsonl``.
5. **Living Wiki**: Semantic concept nodes are linked into ``wiki_md/`` with bidirectional ``[[wikilinks]]``.
6. **Manifest Registration**: ``manifest.jsonl`` is updated with SHA256 hashes for every added asset.
