

MAP.md — Repository Topology & Navigation

Ontology: aesop-xi

Subsystem: `aesop-xi/` (Federated Subsystem Root)

Parent Corpus: `__Novæxorpus_LIVING_MASTER_CANON`

Role: Universal Orchestration Layer, Ethical Policy Governance & Arbitration

1. Directory Structure

`aesop-xi/`

- |— `MAP.md` # This navigational index & component ontology
- |— `manifest.jsonl` # Cryptographic SHA-256 catalog of all files in this repo
- |— `AGENTS.md` # Operating boundaries & invariants for LLMs in aesop-xi
- |— `RESUME.md` # Active session state, checkpoints & verification logs
- |— `UNRESOLVED.md` # Backlog, edge cases & pending architectural tickets
- |
- |— `arbitration/` # Inter-agent priority steering & resource management
 - | |— `arbitration_engine.py` # Inter-agent priority arbitrator & ClearanceToken engine
 - | |— `hardware_throttler.py` # Real-time Hexagon NPU thermal & RAM task shedding
 - |
- |— `policies/` # Strict operational boundaries & security contracts
 - | |— `tool_usage_guardrails.json` # Machine-readable tool permissions & path gates
 - | |— `security_clearance.yaml` # Multi-tenant agent roles & OAuth boundaries
 - | |— `zero_trust_rules.md` # Sensory immutability & sandboxed verification laws

|

└─ .incognito_red_sandbox/ # [SHADOW ISOLATION] Sealed Red Gatekeeper

└─ run_audit.sh # Production continuous bash daemon (/opt/red-agent/)

└─ sandbox_evaluator.py # Adversarial compliance & hallucination evaluator

2. Component Interconnections

- **With novus-aexenti:** `arbitration_engine.py` issues execution clearance tokens to the 0.8B Triage Router and 9B Reasoning Engine; `hardware_throttler.py` forces model downshifts during thermal spikes.
- **With novaecopia:** Validates local ADB loopback (port 5555) execution tokens for `aesc` and audio stream boundaries for `aeypre`.
- **With #d.u.m.b.a.s.s.:** All arbitration decisions and Red Sandbox pass/quarantine audits stream into the universal persistence ledger (`audit_ledger.db`).
