
name: multi-corpora-federation description: Use when an agent plans or executes tasks spanning multiple specialized corpora (Code, DevOps, Assets, Human Knowledge).

Multi-Corpora Federation Skill

The Four Corpora Taxonomy

1. **Code Corpus:** Abstract Syntax Trees (ASTs), interfaces, Kotlin services, Python daemons.
2. **DevOps / Infrastructure Corpus:** Dockerfiles, runtimes, Tailscale configs, ADB loopback setups.
3. **Asset Corpus:** Binary metadata, model weights (.gguf), UI layouts, media samples.
4. **Human Knowledge Corpus:** Markdown notes, specifications, tickets, release changelogs.

Cross-Corpora Execution Heuristics

- **Federated Entity Identity:** Before altering code, verify that the concept is anchored in the central semantic graph (`_dumbass_universal_memory`).
- **Reactive Propagation:** When a code change occurs in the Code Corpus, flag the affected documentation notes in the Human Knowledge Corpus as requiring review.
- **Cross-Layer Integrity:** Never mix raw asset binaries into code trees. Reference assets by hash or local URI pointer.
