

The actual in-depth blueprints live in [📁 The Master /Esop-Xi / Nov/Æ-Core Repository Map](#) and [Root Canonical Workspace](#) (synthesized in [03_WORKSPACE_FILE_TREES_AND_TOPOLOGY_SYNTHESIS.md](#)).

The generic maps collapsed the subsystems, whereas these original blueprints contain the full technical architecture:

1. novaexopia/ ("The Claw" & Multi-APK Runtime)

- **modular_harnesses/ (The 8 Swarm Extensions):**
 - ecc-edge-compute/ — Remote processing harness.
 - prime-agent/ — Local code execution & RLM self-improvement loop.
 - ringer-notif-loop/ — Background system notification & trigger manager.
 - hermes-soul/ — Contextual agent rules & cognitive core settings.
 - aider-workspace/ — Git-tracked CLI workspace agent.
 - local-nanobots/ — Container hooks for the 4 specialized micro-bots.
 - smol-agents/ — Minimal, low-overhead script fragment generator pods.
 - turbo-quant-swarms/ — Quantized reasoning models handling high-speed traffic.
- **mcp_connectors/ (Plugins & Gateway):**
 - anthropic_official/ — Local mirror of Anthropic open-source plug-in library.
 - custom_node_mcp/ — Custom Node.js server configurations.
 - filesystem_mcp/ — Local filesystem visibility interface for agents.
- **Native Daemons:**
 - aesc/ — laptop_trick_tunnel/ (ADB-to-WebSocket local Unix host bridge) & npu_watchdog/.
 - aeyre/ — screen_vision/ (pixel canvas parsing) & voice_ast_stack/ (native VAD, STT, TTS).
 - openwiki-tui-harness/ — Dual profiles: file_administrator.yaml & oeracle_helpdesk.yaml.

2. novus-aexenti/ (Cognitive MoE Engine)

- **dual_agent_router/:** query_analyzer.py & executor_bridge.py.
- **mem0_episodic/:** ob1_static_protocols/ (session forks & time-slice proofs) & vector_recall_engine.py.
- **reasoning_bank/ (System Flywheel):**
 - failure_logs/ — Model error traces in JSONL.
 - reward_variables/ — Efficiency evaluation parameters.
 - frontier_traces/ — Execution traces from frontier models.
 - post_regression/ — baseline_tests/ & regression_audit_report.jsonl.
- **nope_databank/:** Volatile zero-memory sandbox with raw_intercept/ for cloud training intake.

3. file-management-and-skills/ (Master Data Engine)

From [Root Canonical Workspace](#):

- **target-docs-curation/:** Dedicated trees for qualcomm-qairt-sdk/, android-media-assistant/, llama-kernel-ggml/, and unsloth-fine-tuning/.
- **skill-construction-factory/:** base_skill_guideline.md, skill_onboarding_schema.json, and

compiled_capabilities.jsonl.

- **reasoning-bank-ledger/**: active_execution_paths.json and baseline_recovery_matrix.md.

These two source documents represent the granular, multi-layered layout of the actual system.
