

It actually *is* possible to run a Pro subscription account inside of Termux, but the reason it feels impossible is because of how the authentication flow is built.

When you run `claude login`, Anthropic tries to automatically pop open a web browser to complete an OAuth loop. Because Termux operates as a headless terminal without a graphical desktop environment, that automated callback simply fails and the terminal hangs. Anthropic didn't put the kibosh on it; it's just a networking mismatch.

Here is how you bypass that and force the Pro login in a headless environment:

1.Initialize Login:

Run `claude login` in your Termux shell.

2.Copy Auth URL:

When it fails to open a browser, press `c` on your keyboard to copy the raw OAuth URL to your clipboard.

3.Authenticate in Browser:

Open a mobile browser (like Brave or Chrome Dev) and paste the URL, then log in with your Pro credentials.

4.Retrieve Authorization Code:

Because the browser can't reach the local Termux callback server, it will display a raw authorization code on the screen instead of redirecting you.

5.Complete Termux Authentication:

Copy that code, switch back to Termux, and paste it where it says `Paste code here` if prompted.

Once you hit enter, your Termux environment is permanently authenticated to your Pro flat-rate plan.

Where Else Can You Use the Pro Subscription?

If you are trying to avoid API fees, you are restricted to **official Anthropic surfaces**.

Third-party tools like Aider, Open Wiki LLM, or Hermes will always demand a raw API key because they don't have the internal OAuth plumbing to verify your Claude subscription.

Aside from VS Code and Google Cloud Editor, here are the other places you can log in with a Pro/Max account to get flat-rate coding:

- **JetBrains IDEs:** There are official, Pro-supported extensions for IntelliJ, PyCharm, WebStorm, and the rest of the JetBrains suite.
- **The Claude Desktop App:** The native desktop client supports computer use and local terminal dispatch tasks tied directly to your Pro account.

As long as you stay within the official CLI, VS Code, or JetBrains tools, you can run the agent as hard as you want without paying per token.
