
name: w5h-extraction description: "Extracts and formats complete Who, What, When, Where, Why, and How (W5+H) operational matrices from stream-of-consciousness transcripts and unorganized architectural notes."

W5+H Extraction Protocol

Use this skill when processing raw operator voice notes, meeting transcripts, or brainstorming sessions to derive an authoritative system architecture matrix without losing human intent.

Step-by-Step Procedure

1. Ingest & Isolate Raw Input

- Read the unstructured input completely before segmenting.
- Identify all explicit names, model types, hardware specifications, and personal constraints.
- Note any verbatim directives, invariants, or prohibitions (e.g., non-destructive file rules, naming requirements).

2. Extract the Six Dimensions

Populate each dimension using concise, factual language:

1. **WHO:**

- Primary human operators and decision-makers.
- Distinct agent personas and service daemons (e.g., UI shell, terminal daemon, media daemon, router, auditor).

2. **WHAT:**

- Core functional deliverable or software system being constructed.
- Target schemas, data structures, and database engines.

3. **WHEN:**

- Active project phase and immediate priority milestones.
- Trigger conditions: real-time execution, daily batch handoff, or scheduled maintenance sweeps.

4. **WHERE:**

- Physical hardware nodes (e.g., phone, server board, workstation, cloud provider).
- Filesystem paths, port bindings, and communication socket routes.

5. **WHY:**

- Technical root problem being solved (e.g., preventing LMK crashes, avoiding context window bloat, cost optimization).
- Core architectural invariants and safety guarantees.

6. **HOW:**

- Underlying protocols, CLI commands, scripts, and libraries.
- Dataflow sequence from ingress to final verification.

3. Format Output

Present the final analysis as a markdown comparison table followed by an ASCII topology diagram, highlighting any open tickets or unresolved questions for operator review.
